

## Adolescent civic engagement: Lessons from Black Lives Matter

### Supporting Results

#### *Parsing the multiracial/other group*

Given the relative paucity of research examining race-related effects among multiracial Black adolescents in general and with regard to civic engagement more specifically, we recoded the race/ethnicity variable to separate out adolescents who identified as Black and any other race/ethnic group. The recode resulted in six groups: White, Black, Hispanic, Asian, Multiracial-Black, and multiracial/other. First, we re-ran the main models which had Black adolescents as the reference group. All results were replicated and in the majority of models Black and Multiracial-Black adolescents did not significantly differ. The one exception was that Black adolescents reported higher feelings of fear when parents attended demonstrations without them compared to adolescents in the Multiracial-Black group ( $B = -0.40$ ,  $SE = 0.17$ , 95% CI  $[-0.74, -0.06]$ ,  $p = 0.02$ ). Thus, Black adolescents report more fear when parents attend demonstrations without them compared to adolescents who identify as White, Asian, or Multiracial-Black.

Second, we ran another set of models using adolescents in the Multiracial-Black race/ethnicity group as the reference group (see SI Tables 3 and 4). Generally, the Multiracial-Black group differed in engagement and feelings related to BLM-related media/social media from adolescents who were White, Asian, and in the multiracial/other group. There were no differences between Multiracial-Black adolescents and Black or Hispanic adolescents. Further, while adolescents who identified as Multiracial-Black attended more demonstrations than adolescents who identified as White, Asian, Hispanic or multiracial/other, the Multiracial-Black adolescents did not differ from other racial groups on feelings related to attending demonstrations or behaviors of police or other demonstrators witnessed during demonstrations. Finally, Multiracial-Black adolescents more frequently reported parents going to demonstrations without them compared to Asian and Hispanic adolescents; siblings going to demonstrations without them compared to White, Asian, and Hispanic adolescents; and neighbors going

to demonstrations without them than White, Asian, Hispanic, and multiracial/other adolescents.

Adolescents who identified as Multiracial-Black reported more fear and pride than Asian adolescents when siblings attended demonstrations without them and less fear than Black adolescents when parents attended demonstrations without them, but no other differences in feelings regarding family engagement in BLM demonstrations emerged. In sum, the experiences of Black adolescents who are multiracial largely were statistically similar to adolescents who identify as Black; however, descriptively Multiracial-Black adolescents did not report as many systematic differences from other racial/ethnic groups in experiences (e.g., witnessing violence during demonstrations) and feeling related to various modes of engagement with the BLM movement compared to Black adolescents.
